Questions:

1: Generate 4 sets of minimum phase synthetic data for signal to noise ratio values of a) 10 b) 25 c) 50 and d) 100. Now, for each of the datasets, you need to figure out:

optimum spiking (gap) lag (0.004 to 0.02 s)

optimum operator length (0.1 to 2s)

optimum pre whitening parameter (0.0001 to 0.01)

2: Deconvolution on viking graben data: ntg: On the t^2 corrected ntg gather, minimum phased using sushape: Try to eliminate the sea bottom multiples using predictive error filtering (supef). Bandpass filter the data after deconvolution. Pick the optimum parameters for deconvolution. Are the multiples attenuated?

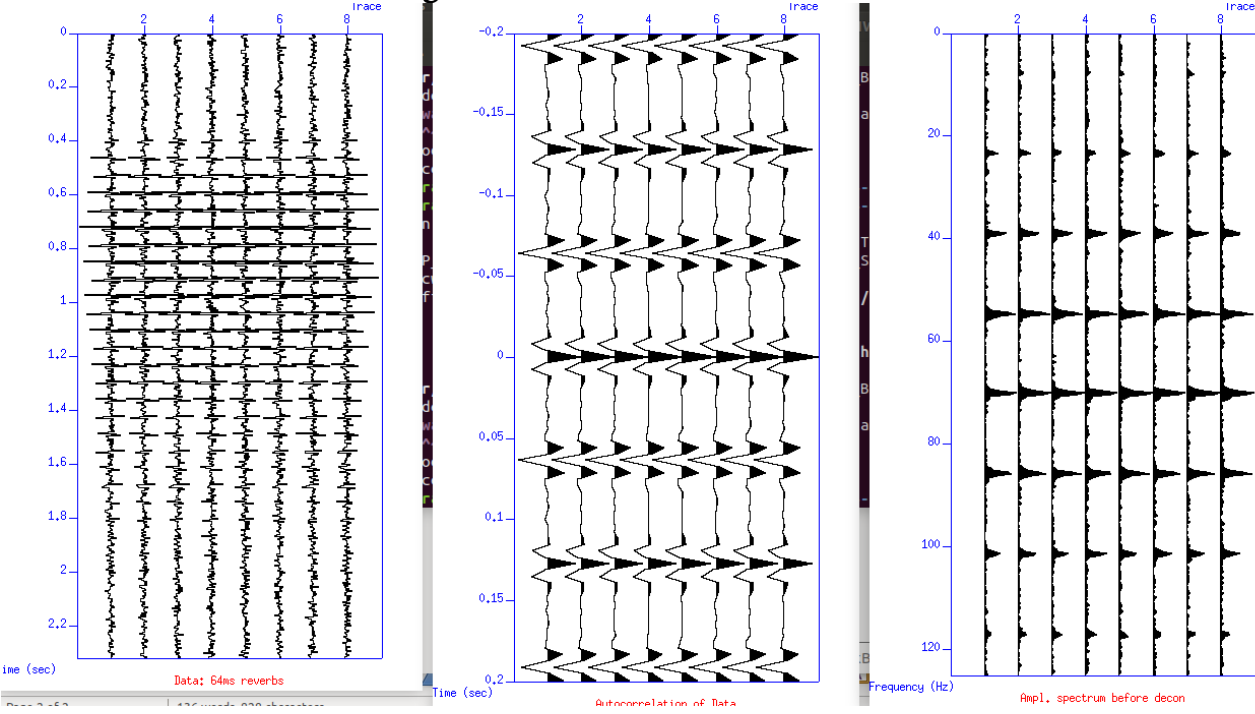

3: Deconvolution on viking graben data: CMP gathers

Question 1:

Here in this exercise the best minimum prediction lag is 0.005 sec or around 5 ms. And the optimum operator length is around 0.5 sec.

SNR : 10

Characteristics of seismogram:

SNR : 10

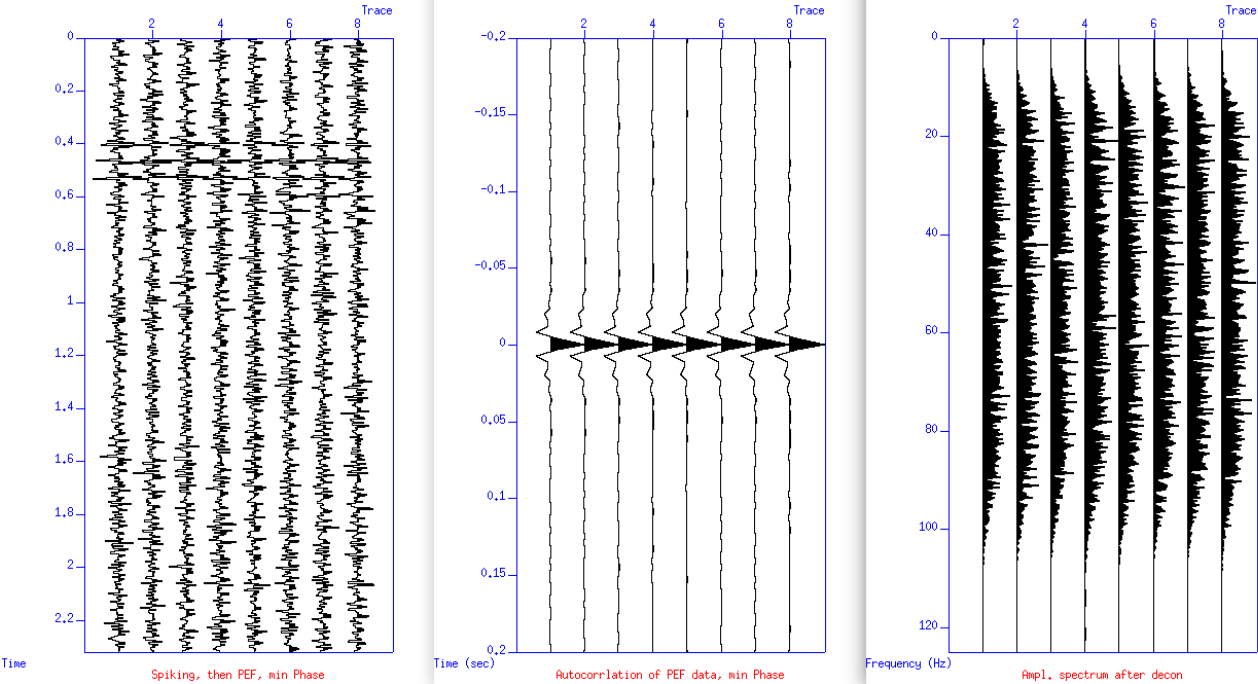

MINLAG_pmf: 0.005 sec

MAXLAG_pmf: 0.2 sec

Whitening Noise: 0.2%

SNR : 10
MINLAG_pef: 0.005 sec
MAXLAG_pef: 0.4 sec
Whitening Noise: 0.2%

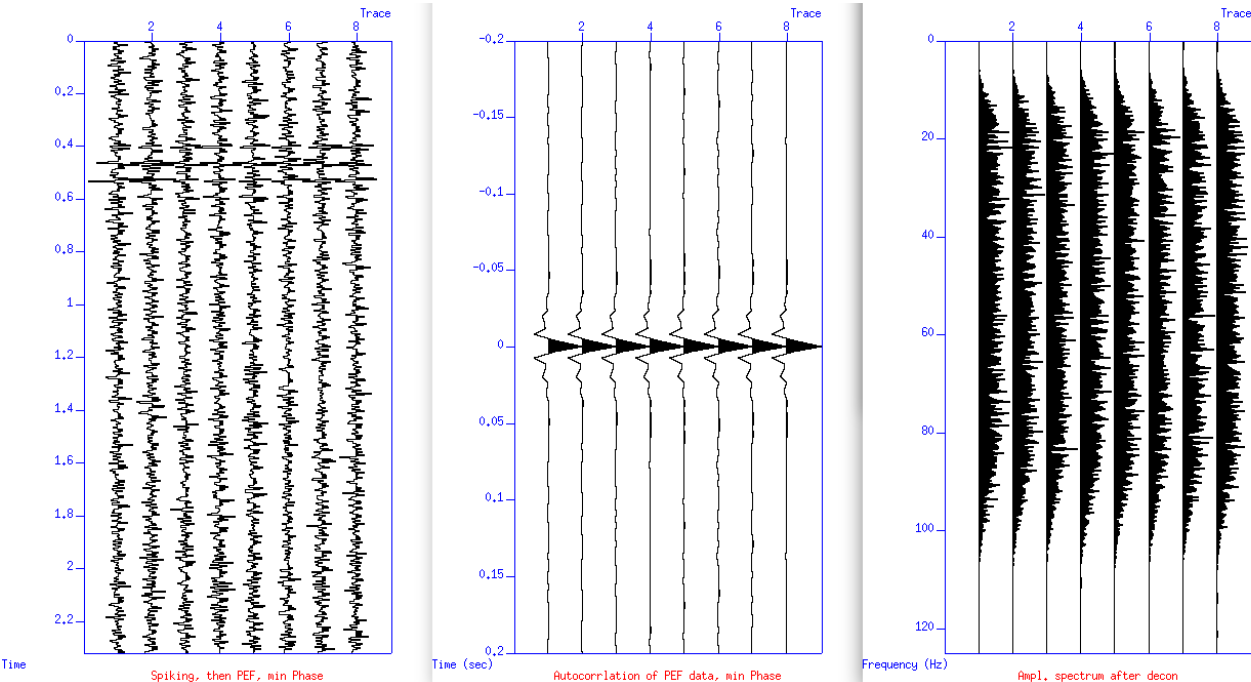

SNR : 10
MINLAG_pef: 0.005 sec
MAXLAG_pef: 0.4 sec
Whitening Noise: 0.2%

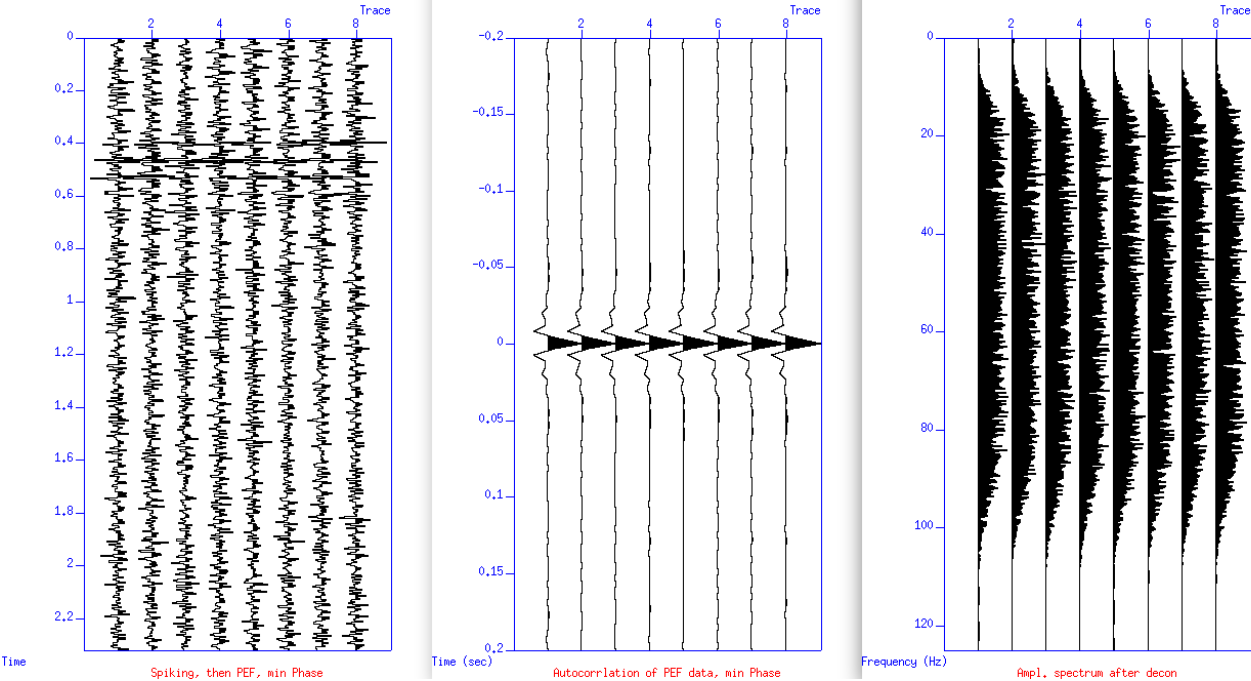

SNR : 10
MIN LAG: 0.005 sec
MAX LAG : 0.5 sec
Whitening Noise: 0.2%

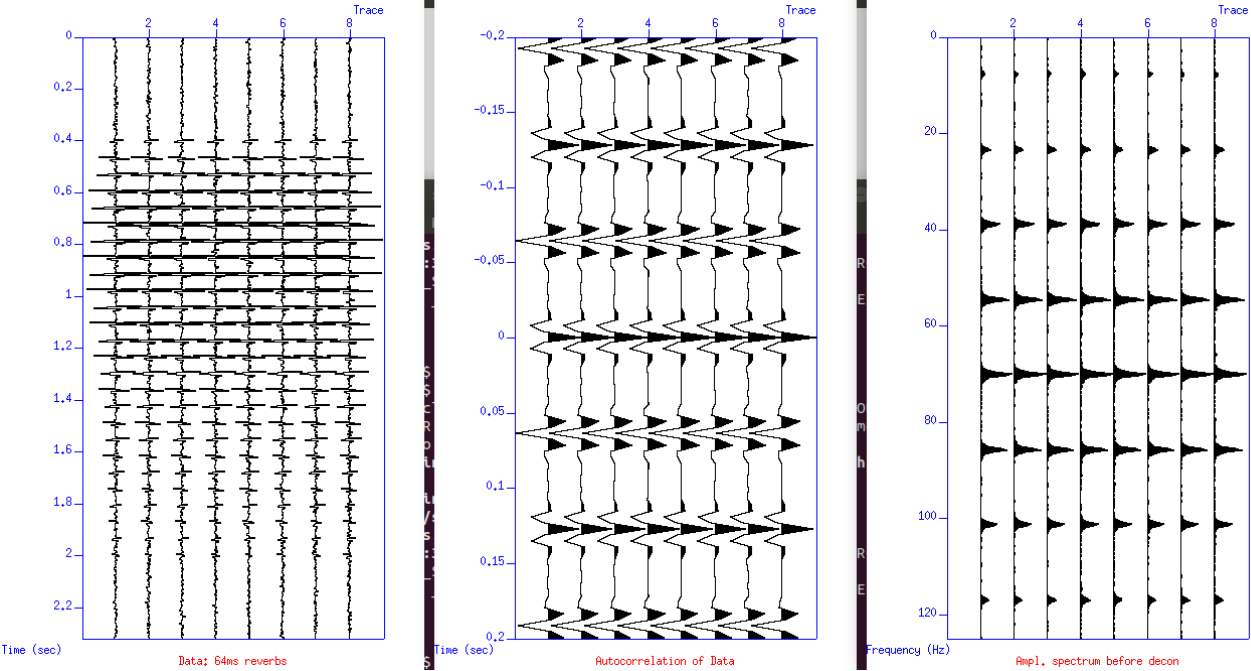

SNR : 10
MIN LAG: 0.005 sec
MAX LAG : 0.6 sec
Whitening Noise: 0.2%

SNR : 10
MIN LAG: 0.005 sec
MAX LAG : 1.2 sec
Whitening Noise: 0.2%

SNR : 25
Characteristic of the seismogram:

SNR : 25
MIN LAG: 0.005 sec
MAX LAG : 0.2 sec
Whitening Noise: 0.2%

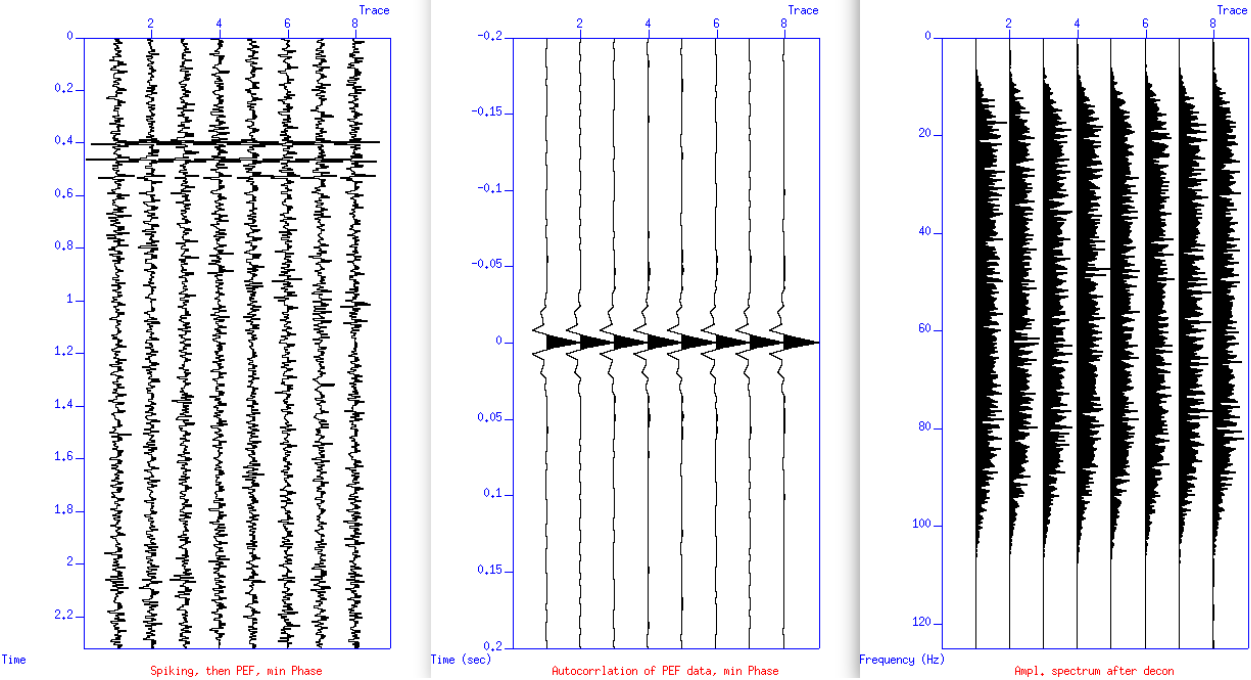

SNR : 25
MIN LAG: 0.005 sec
MAX LAG : 0.4 sec
Whitening Noise: 0.2%

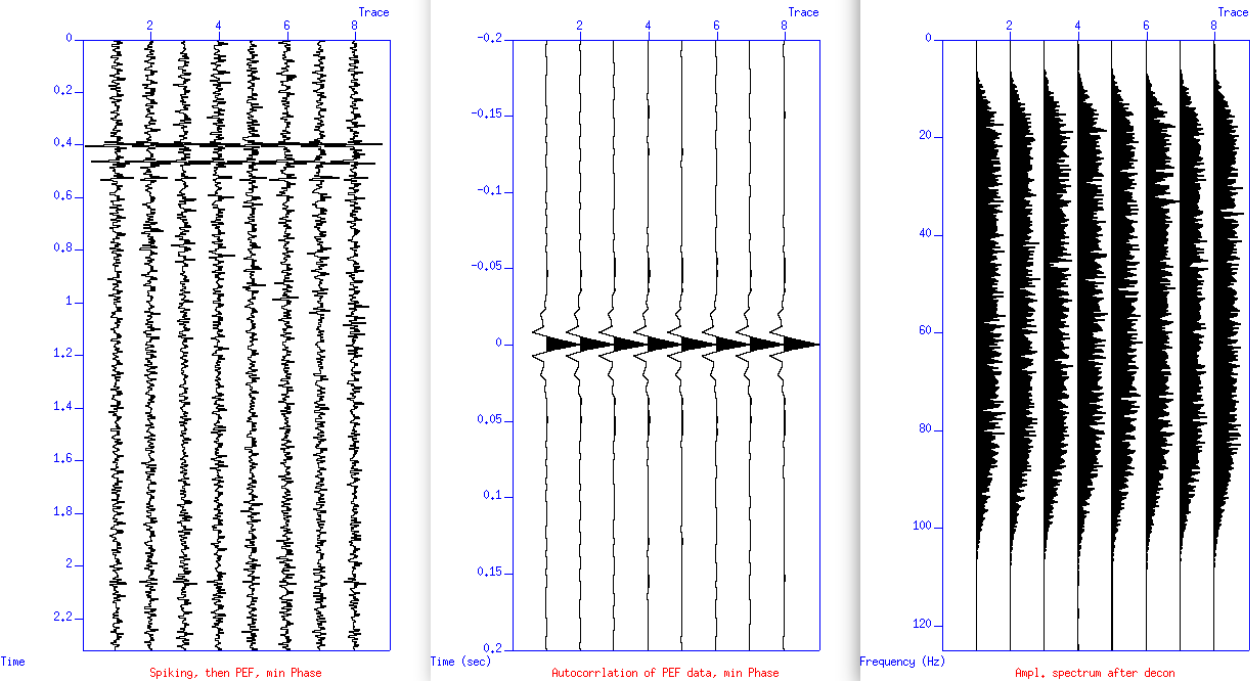

SNR : 25
MIN LAG: 0.005 sec
MAX LAG : 0.5 sec
Whitening Noise: 0.2%

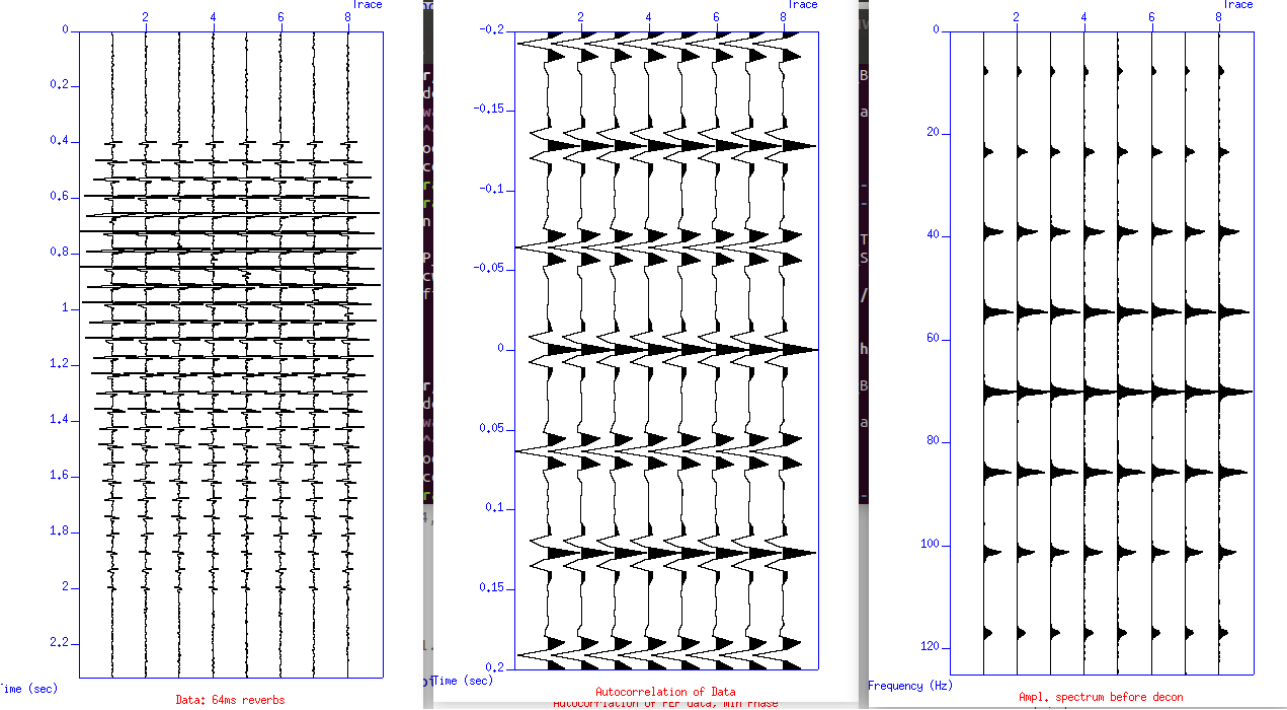

SNR : 25
MIN LAG: 0.005 sec
MAX LAG : 0.6 sec
Whitening Noise: 0.2%

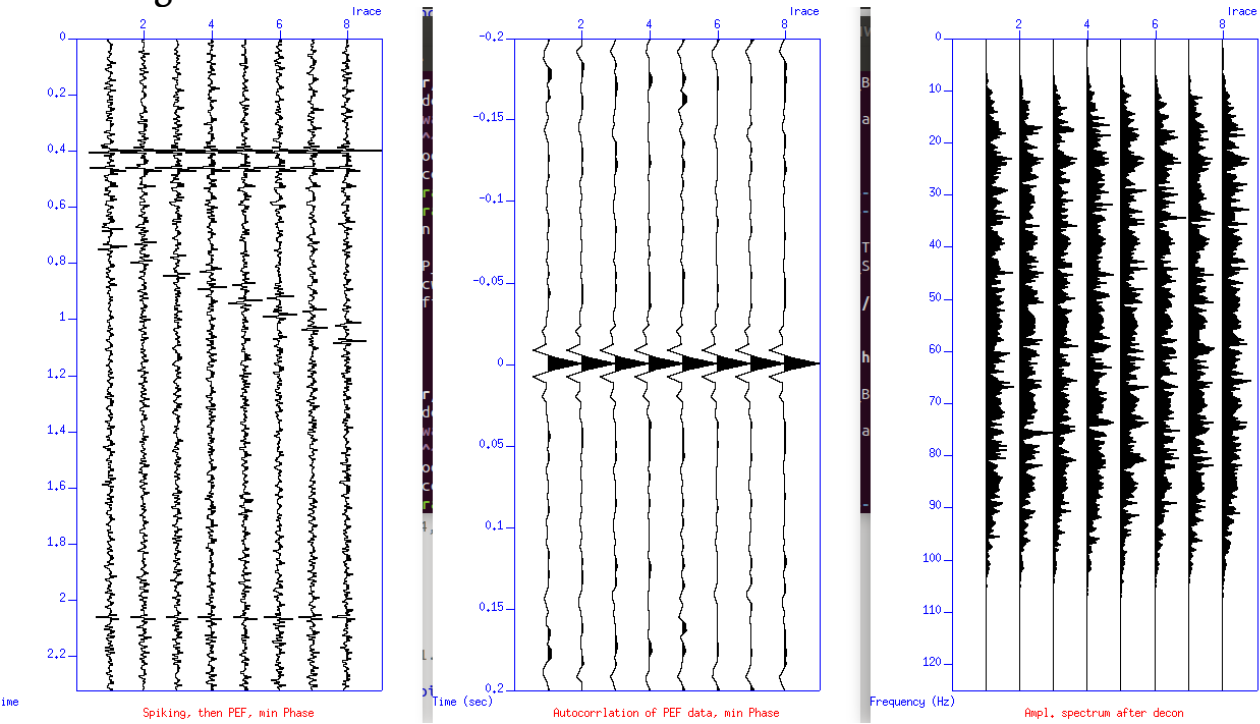

SNR : 25
 MIN LAG: 0.005 sec
 MAX LAG : 1.2 sec
 Whitening Noise: 0.2%

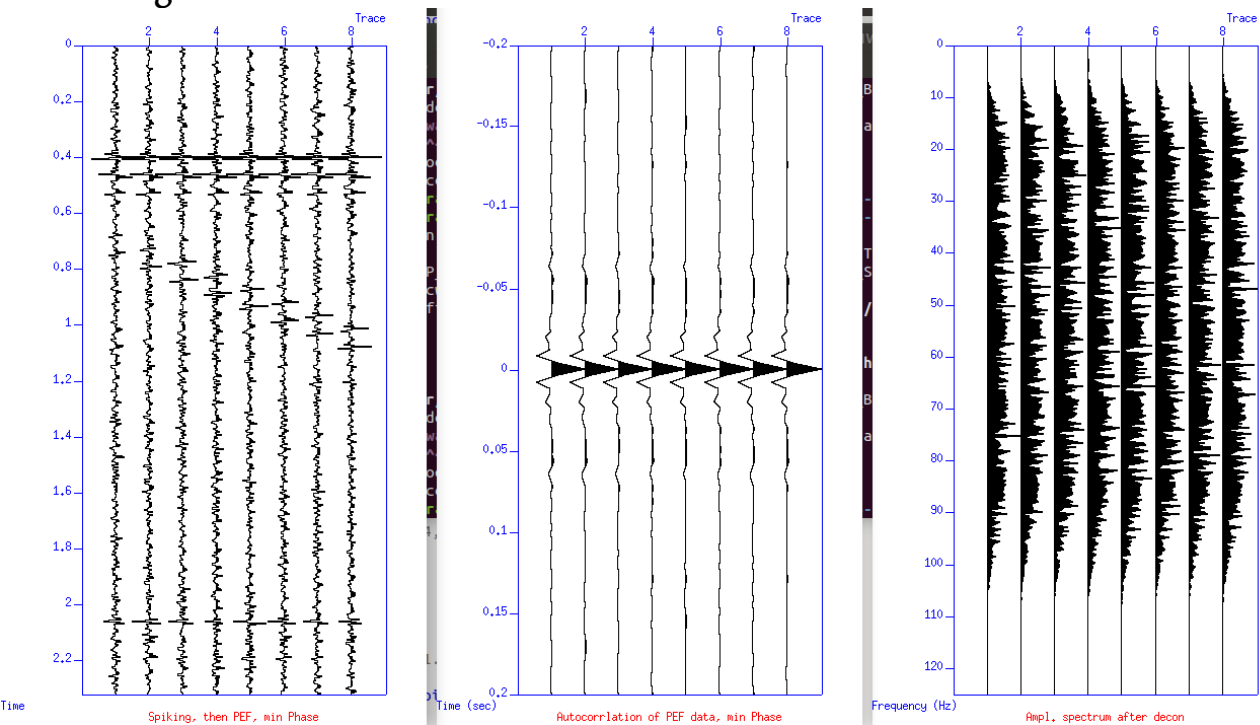

SNR: 50
 Characteristic of seismogram:

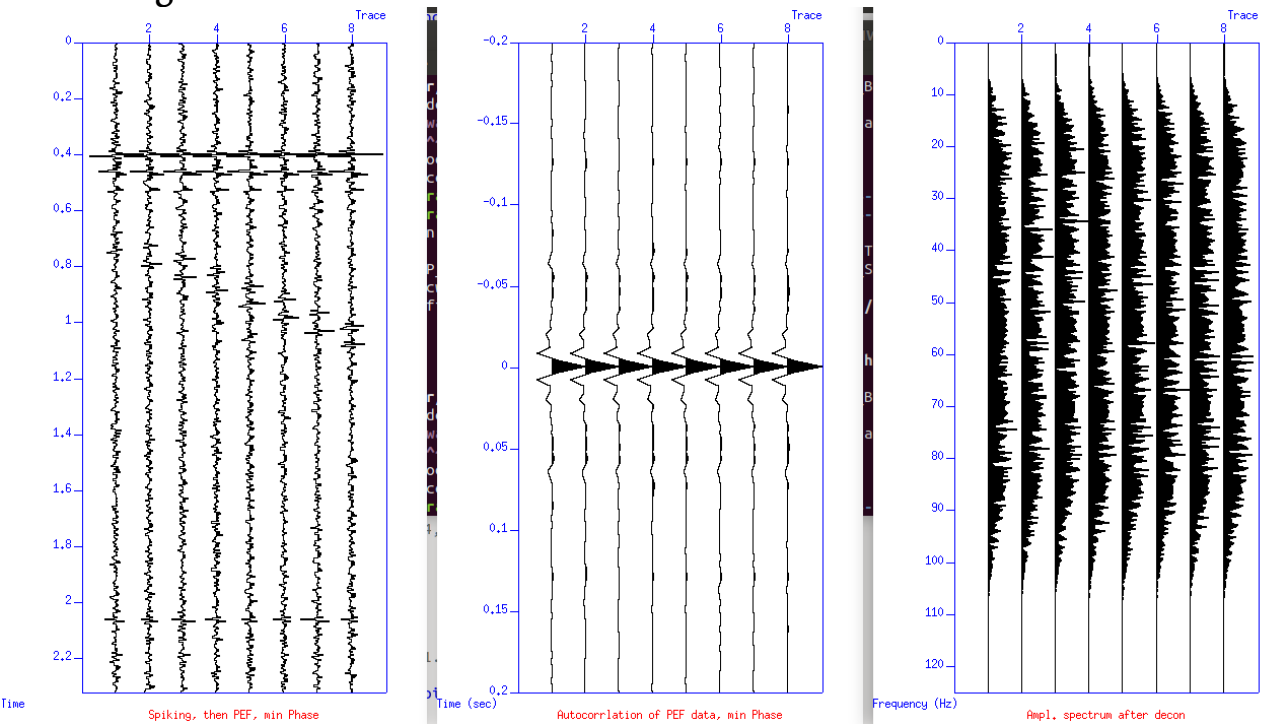

SNR : 50
MIN LAG: 0.005 sec
MAX LAG : 0.2 sec
Whitening Noise: 0.2%

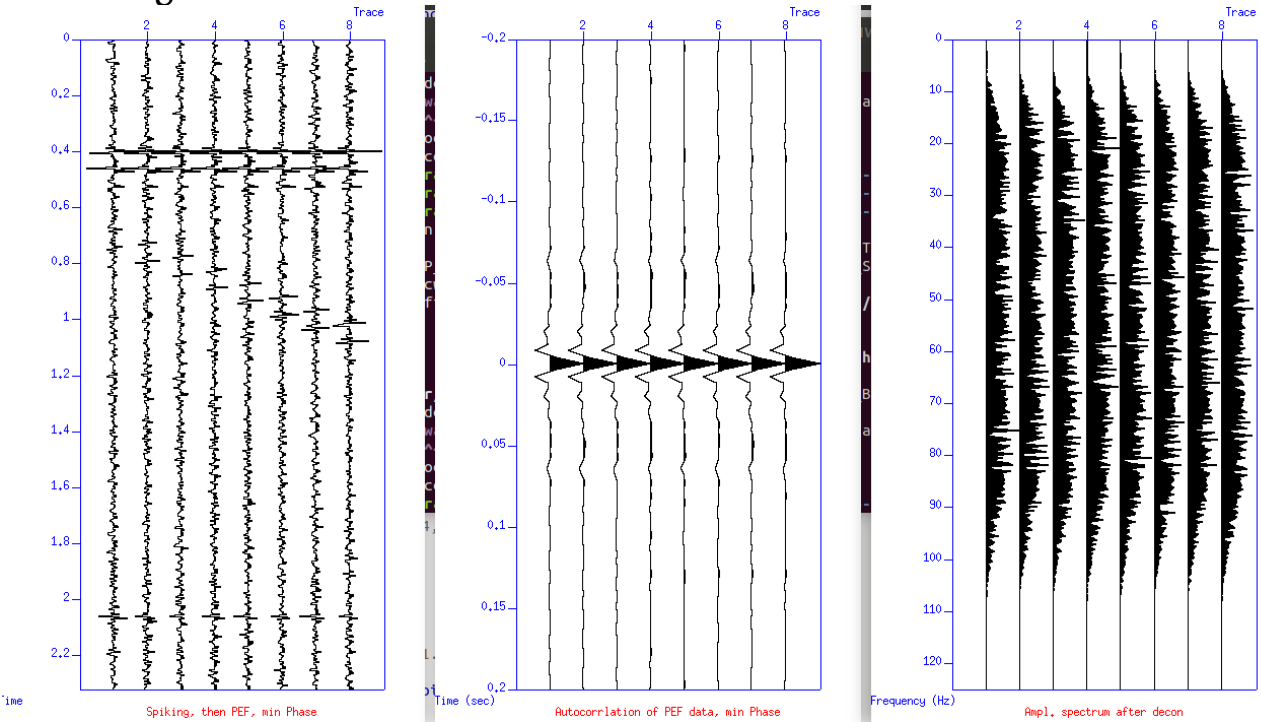

SNR : 50
MIN LAG: 0.005 sec
MAX LAG : 0.4 sec
Whitening Noise: 0.2%

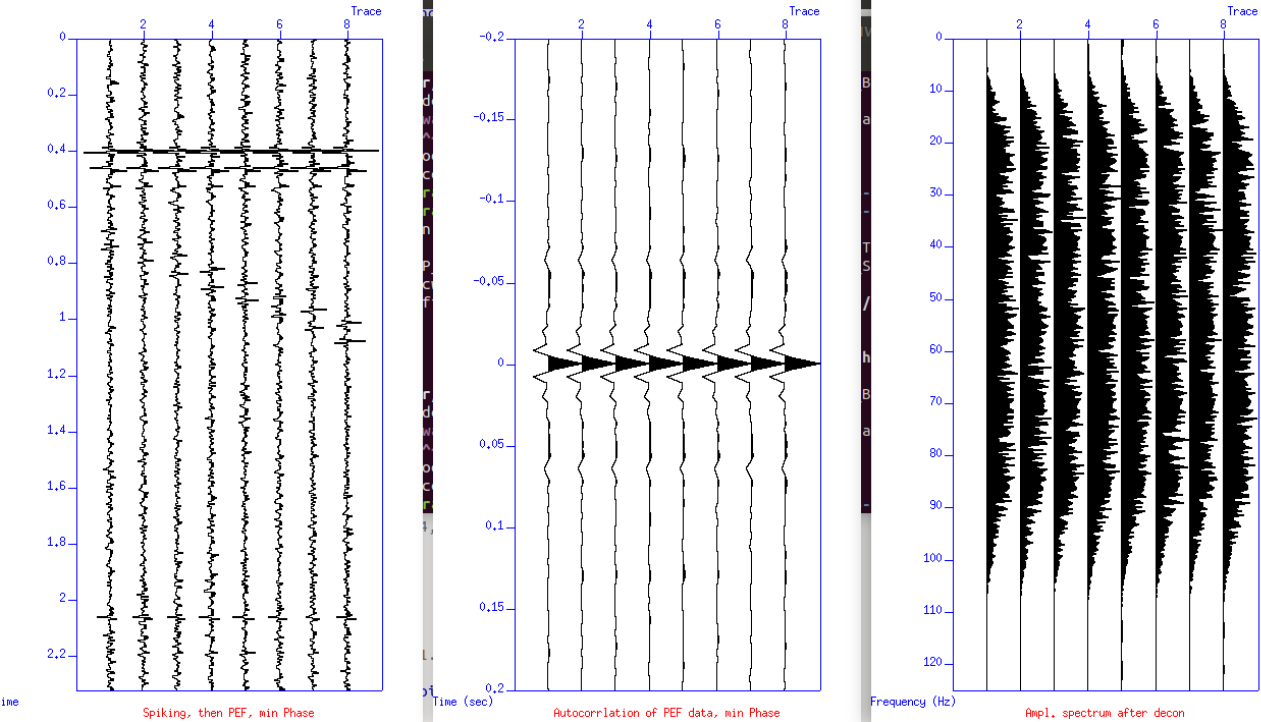

SNR : 50
MIN LAG: 0.005 sec
MAX LAG : 0.5 sec
Whitening Noise: 0.2%

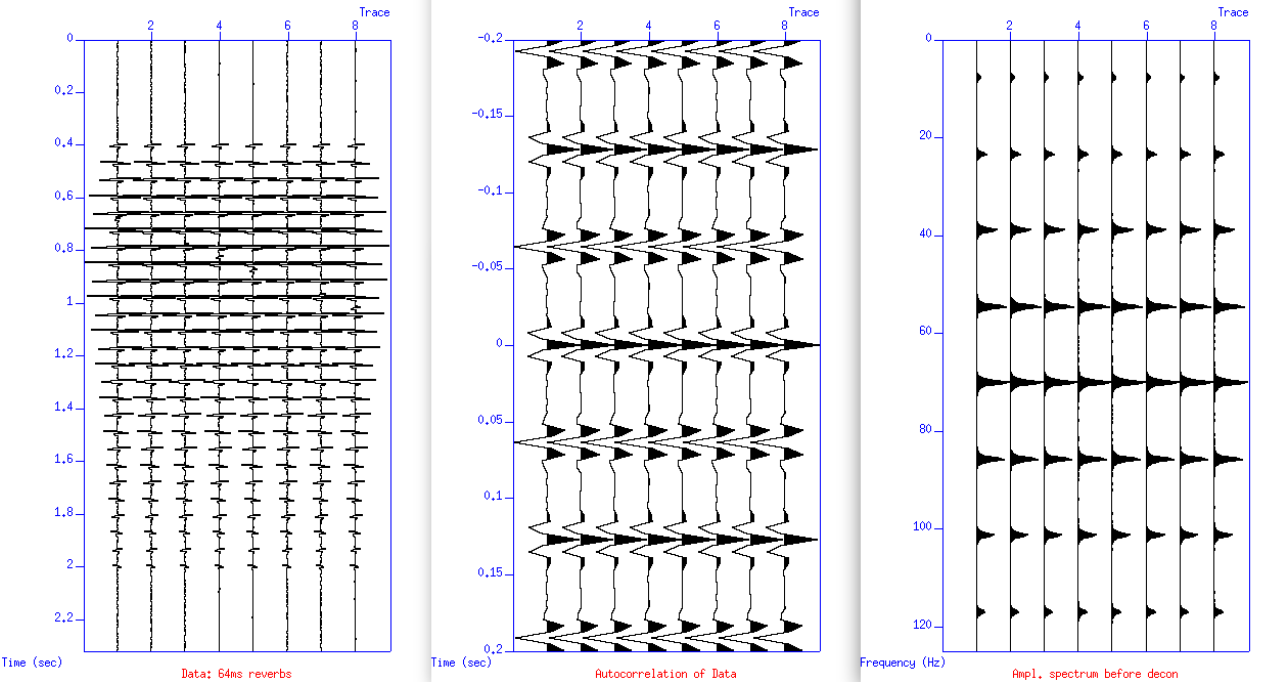

SNR : 50
MIN LAG: 0.005 sec
MAX LAG : 0.6 sec
Whitening Noise: 0.2%

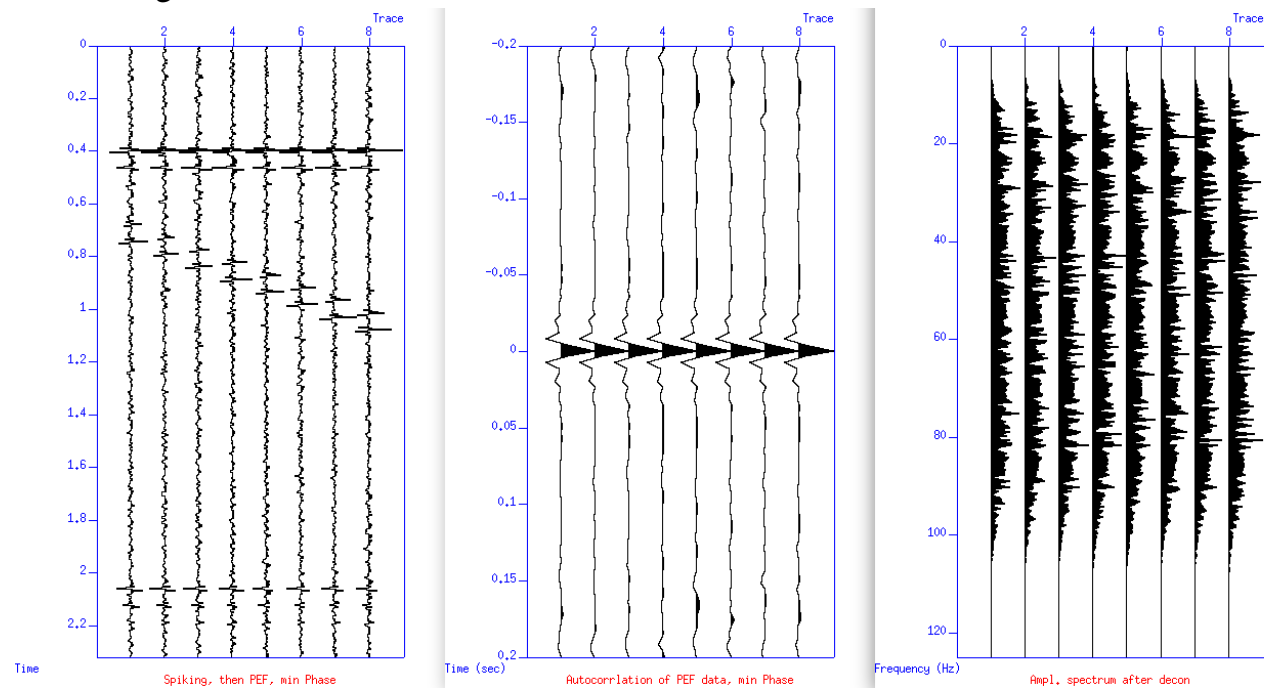

SNR : 50
MIN LAG: 0.005 sec
MAX LAG : 1.2 sec
Whitening Noise: 0.2%

SNR 100
Characteristic of seismogram:

SNR : 100
MIN LAG: 0.005 sec
MAX LAG : 0.2 sec
Whitening Noise: 0.2%

SNR : 100
MIN LAG: 0.005 sec
MAX LAG : 0.4 sec
Whitening Noise: 0.2%

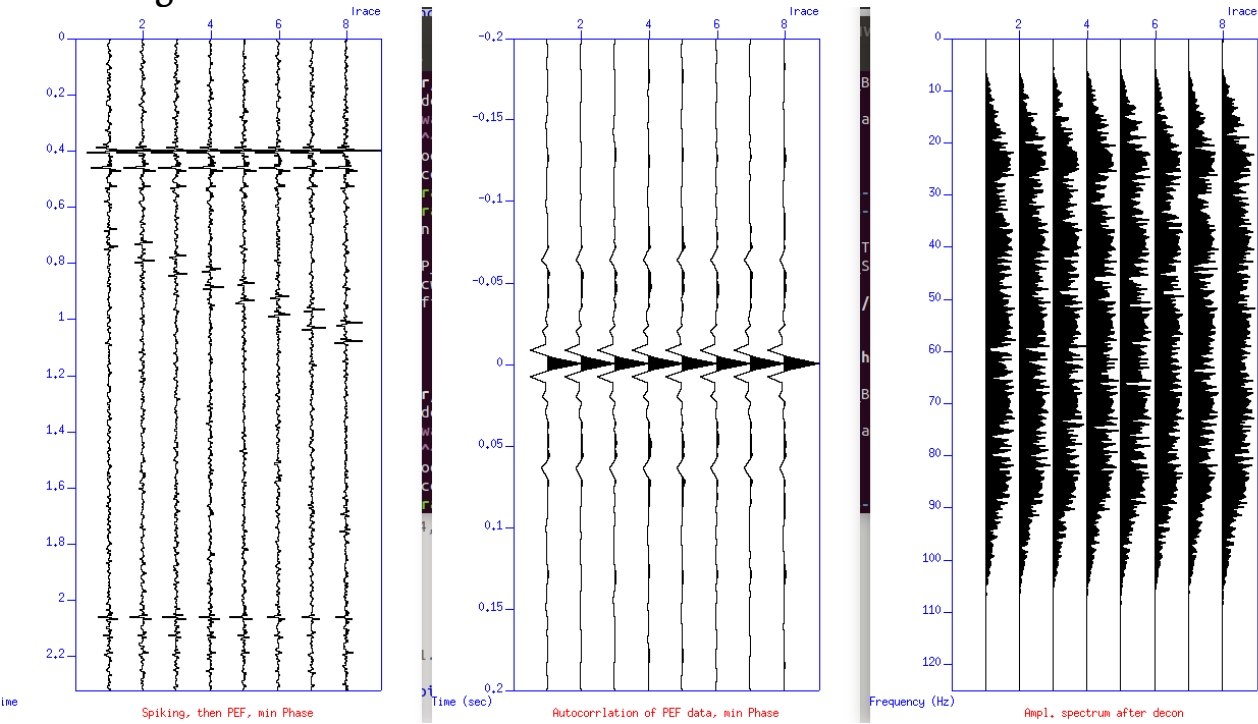

SNR : 100
MIN LAG: 0.005 sec
MAX LAG : 0.5 sec
Whitening Noise: 0.2%

SNR : 100
MIN LAG: 0.005 sec
MAX LAG : 0.6 sec
Whitening Noise: 0.2%

SNR : 100
MIN LAG: 0.005 sec
MAX LAG : 1.2 sec
Whitening Noise: 0.2%

Solution of question 2:

We took static corrected near trace gather with t^2 gain and farfield wavelet and made a minimum phase equivalent.

T^2 gain static corrected near trace gather

Minimum phase near trace gather

```
sushape < stat_t2_ntgather.su wfile=resamp_farfield.su  
dfile=minphs_farfield.su showshaper=1 nshape=1500 2>shaper.asc  
>minphs_ntgather.su
```

Autocorrelation of minimum phase near trace gather:

```
suacor <minphs_ntgather.su ntout=1001 | suximage f1=2.0 perc=99  
label2="trace" label1="lag (sec)" title="autocorrelation of minimum phase near  
trace gather" windowtitle="autocorrelation of minimum phase near trace  
gather" &
```

Amplitude spectrum of minimum phase near trace gather:

```
$ sufft <minphs_ntgather.su | suamp mode=amp| suxwigg label1="frequency"  
label2="trace" title="minimum phase ntg in frequency domain" &
```

Autocorrelation of minimum phase near trace gather

```
suacor <minphs_ntgather.su ntout=1001 | suxwigg f1=2.0 perc=99  
label2="trace" label1="lag (sec)" title="autocorrelation of minimum phase near  
trace gather" &
```

Predictive Deconvolution with minlag=0.1 maxlag=0.7

```
supef <minphs_ntgather.su minlag=0.1 maxlag=0.7  
>minphs_pef_ntgather.su
```

```
sufft <minphs_pef_ntgather.su | suamp mode=amp| suxwigg  
label1="frequency" label2="trace" title="minimum phase ntg in frequency  
domain after pef " &
```

Minimum Phase near trace gather after Predictive Deconvolution and bandpass filter:

We applied filter as we can see that there is not much energy after 60 Hz.

```
sufilter <minphs_pef_ntgather.su f=0,3,50,60 amps=0,1,1,0  
>minphs_filt_ntgather.su
```

Autocorrelation of PEF minimum phase near trace gather:

suacor <minphs_filt_ntgather.su ntout=1001 | suximage f1=2.0 perc=99
label2="trace" label1="lag (sec)" title="autocorrelation of minimum phase near
trace gqather after pef" &

Amplitude Spectrum of minimum phase PEF filter gather:

sufft <minphs_filt_ntgather.su | suamp mode=amp| suxwigg
label1="frequency" label2="trace" title="minimum phase ntg in frequency
domain after pef " &

Optimum parameter for minimum phase near trace gather are minimum lag=0.1 and and maxlag=0.7. Which almost removes multiples in ntg gather.

Solution of question 3:

We took static corrected 3 cdp gather with t^2 gain and farfield wavelet and made a minimum phase equivalent.

NMO Correction-

sunmo <stat_t2_3cdphdrs1.su >3cdpnmocorrected.su vnmo=1440

Minimum Phase 3 CDP gather:

```
sushape <3cdpnmocorrected.su wfile=resamp_farfield.su dfile=minphs_farfield.su  
showshaper=1 nshape=1500 2>shaper.asc >minphs_3cdpgather.su
```

Autocorrection of minimum phase nmo corrected 3CDP gather:

```
suacor <minphs_3cdpgather.su ntout=1001 | suximage f1=-2.0 perc=99  
label2="trace" label1="lag (sec)" title="autocorrelation of minimum phase  
3cdp gather" windowtitle="autocorrelation of minimum phase 3cdp nmo  
corrected gather" &
```

Amplitude Spectrum of minimum Phase 3CDP gather:

suftt <minphs_3cdpgather.su | suamp mode=amp| suxwigg label1="frequency" label2="trace" title="minimum phase ntg in frequency domain" &

Autocorrelation of minimum phase 3CDP gather:

suacor <minphs_3cdpgather.su ntout=1001 | suxwigg f1=2.0 label2="trace" label1="lag (sec)" title="autocorrelation of minimum phase 3cdpgather" &

from here we select minimum lag=.12 sec.

Amplitude Spectrum of minphase 3CDP gather after Predictive Deconvolution:

```
supef <minphs_3cdpgather.su minlag=0.12 maxlag=0.7  
>minphs_pef_3cdpgather.su
```

```
sufft <minphs_pef_3cdpgather.su | suamp mode=amp| suxwigg  
label1="frequency" label2="trace" title="minimum phase 3cdp in frequency  
domain after pef " &
```

Band Pass Filtering of 3CDP gather after predictive Deconvolution:

```
sufilter <minphs_pef_3cdpgather.su f=0,3,50,60 amps=0,1,1,0  
>minphs_filt_3cdpgather.su
```

Autocorrelation of Minimum phase gather after Predictive Deconvolution:

suacor <minphs_filt_3cdpgather.su ntout=1001 | suximage f1=2.0 perc=99
label2="trace" label1="lag (sec)" title="autocorrelation of minimum phase
3cdp gather after pef" &

Amplitude Spectrum of Minimum phase 3CDP gather after PEF:

```
sufft <minphs_filt_3cdpgather.su | suamp mode=amp| suxwigb  
label1="frequency" label2="trace" title="minimum phase 3cdp in frequency  
domain after pef " &
```
